COMPANY PROFILE

CADILLACTECH specializes in full spectrum cybersecurity consulting, implementation, and operations for government and defense clients. We follow a disciplined regimen that always begins with clearly defined requirements and goals with measurable outcomes and continuous improvement. Founded in 2018 and based in Cadillac, Michigan, our leadership brings over 25 years of relevant experience in cybersecurity and general technology management to government and private sector clients.

SERVICES AT A GLANCE

Cybersecurity Consulting – Our consulting services cover penetration testing, systems and configuration analysis, examination of existing security implementations, risk/threat assessments, and impact analysis. We map each area to business goals and rules, and develop remediation strategies to eliminate areas of weakness, and measure and monitor performance.

Solution Implementation – As a natural follow-on to our consulting services, we establish core business requirements and help clients identify the most effective solutions that meet or exceed those requirements. We develop architecture and detailed designs, establish implementation plans and can provide white-glove installation and configuration of the chosen solutions.

Operations & Support – Rounding off our portfolio is the ability to operate and support your mission-critical environment. This includes end user support, event monitoring and analysis, crisis and war room management, and general staff augmentation.
